

## **AMENDMENTS TO THE ABSTRACT:**

Please accept the following abstract in response to paragraph 1 on page 2 of the

Office Action:

### **ABSTRACT OF THE DISCLOSURE**

The glass ceramic or glass body is decorated with a colorant based on a silicate melt containing from about 1 to 30 percent by weight of a special-effect pigment, which provides a color-flop effect. The color-flop pigment consists of synthetically produced plane-parallel silicon dioxide platelets coated with metal oxides, such as titanium dioxide. The color-flop pigment is preferably a dry free-flowing powder containing 52 - 66 wt.% of  $\text{SiO}_2$ , 32 - 42 wt.% of  $\text{TiO}_2$ ; 1 - 5 wt.% of  $\text{SnO}_2$ ; and 0 - 3 wt.% of  $\text{ZrO}_2$  in which more than 80 % of the platelets have a particle size of from 5 to 40  $\mu\text{m}$ . A glass ceramic cooking surface can be decorated with this colorant to provide a decorated glass ceramic cooking surface that withstands high heat loads.
